        New isolated Enterococcus faecalis polynucleotides - used to develop products for the detection of Enterococcus and for use in vaccines for prevention or attenuation of Enterococcus infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a protein isolated from Enterococcus faecalis. The present invention describes genes, proteins and antigenic polypeptides isolated from E. faecalis. The proteins can be used in vaccines for preventing or attenuating an infection caused by a member of the Enterococcus genus in an animal. They can also be used for detecting Enterococcus antibodies in a sample. The nucleotide sequences can be used for detecting Enterococcus nucleic acids. Products from the present invention can also be used for screening
                                                                N-PSDB;

The present invention describes genes, proteins and antigenic polypeptides isolated from E. faecalis. The proteins can be used in vaccines for preventing or attenuating an infection caused by a member of the Enterococcus genus in an animal. They can also be used for detecting Enterococcus antibodies in a sample. The nucleotide

The present invention describes genes, proteins and antigenic polypeptides isolated from E. faecalis. The proteins can be used in vaccines for preventing or attenuating an infection caused by a member of the Enterococcus genus in an animal. They can also be used for detecting Enterococcus antibodies in a sample. The nucleotide sequences can be used for detecting Enterococcus nucleic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                isolated from Enterococcus faecalis. The present invention describes genes, proteins and antigenic polypeptides isolated from E. faecalis. The proteins can be used in vaccines for preventing or attenuating an infection caused by a member of the Enterococcus genus in an animal. They can also be used for detecting Enterococcus antibodies in a sample
                                                              Nucleic acid encoding antigenic peptide(s) from Streptococcus pneumoniae - or their epitope-containing fragments, useful in protective or therapeutic vaccines, and for diagnosis
                                                                                                                                                                                                                                                                                                                                                                                      Streptococcus

Probes based on the nucleic acid are used to detect Streptococcus infection (by usual hybridisation or amplification methods), also for isolating Streptococcus genes or their allelic variants. The protein can be used similarly to detect specific antibodies in standard immunoassays, especially for diagnosing or monitoring infections. Antibodies which bind the protein are used to detect corresponding antigens, to purify the protein and for passive immunisation (optionally coupled to a toxin). Vaccines are administered, e.g. by injection, orally or through the skin, typically at 0.01-1000 (especially 10-300) mu g/ml per dose.

identified and these polypeptides can be used in a vaccine composition against S.aureus infection. The polypeptides can also be used in a kit for the immunodetection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, foo poisoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The DNA sequences (and their fragments) are useful as primers or
                                                                                                                                                                                                                                                                                                                 disk, random access memory (RAM), read-only memory (ROM) or cD-ROM. Homology searches using the Saureus Die Gequences allows putative functions to be assigned so that protein encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are likely to encode antigens have been industriated and the sequences of the sequences which are likely to encode antigens have been industrial and the sequences.

                                                                                                                                                                                                                                                                                                                                         망
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC This invention describes a novel method for the diagnosis of a disease CC caused by, or associated with, an RNA molecule that has a frameshift CC mutation. The method is used to diagnose age-related diseases, especially CC cancer and a wide range of neurodegenerative disorders (e.g. Alzhelmer's CC disease, Down's syndrome, myotonic dystrophy, Huntington's disease, CC multiple sclerosis, alcoholic liver disease, diabetes mellitus type II CC and many others listed) or susceptibility to these disorders. The method CC allows a definitive diagnosis of Alzhelmer's disease in living pattents, CC at an early stage. It is based on the observation that disease may be CC caused by mutations in RNA rather than DNA. The invention describes the CC used of neuronal system RNA molecules, specifically proteins including CC beta-amyloid procursor protein (beta-APP), the microtubule associated CC proteins Tau and Big Tau, ubiquitin B, apolipoprotein E, microtubule CC associated protein 2 (MAP2), neurofilament-L, neurofilament-R, CC protein (GFAP), the cellular tumour antigen p53, B-cell leukemia/lymphoma CC protein-C (HMGP-C) and neuroendocribe specific protein abolility group CC protein-C (MGPC) and neuroendocribe specific protein a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          disease, sarcoidosis, sinusitis, purulent offitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see Y34584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Y34584-Y35879 represent the proteins encoded by all the open reading frames in the complete genome (see X91990) of Chlamydia pneumoniae. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart

Probes based on the nucleic acid are used to detect Streptococcus infection (by usual hybridisation or amplification methods), also for isolating Streptococcus genes or their allelic variants. The protein can be used similarly to detect specific antibodies in standard immunoassays, especially for diagnosing or monitoring infections. Antibodies which bind the protein are used to detect corresponding antigens, to purify the protein and for passive immunisation (optionally coupled to a toxin). Vaccines are administered, e.g. by injection, orally or through the skin, typically at 0.01-1000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WPI; 19

The specification describes monoclonal antibodies which bind epitopes of the PsaA protein (see Y30351-54). These peptides can be used in vaccines to prevent Streptococcus pneumoniae infections. The antibodies of the invention can also be used to detect S. pneumoniae a sample or individual.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This sequence represents a Streptococcus pneumoniae 37-kDa surface adhesion A protein. This encoding nucleic acid can be used in methods to express recombinant protein, as a source of primers for amplification (to identify and isolate related sequences, e.g. alleleic variants) or probes for nucleic acid hybridisation tests for detecting S. pneumoniae, and in DNA vaccines. This protein and its fragments can be used to raise antibodies, in vaccines and for detecting S. pneumoniae (by reaction with specific antibodies). Antibodies are useful in diagnostic immunoassays, to treat infections and to raise anti-idiotype antibodies for use in vaccines. This protein is very highly conserved between the different serotypes of S. pneumoniae so is an excellent candidate for vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Streptococcus pneumon antibacterial; antiin pneumococcal disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequences have antibacterial and antiinflammatory properties. The protein sequences, and fragments of them, are useful as immunogens and/or antigens. The nucleotide sequences can be used in vaccines and in diagnostic assays. The proteins and nucleotides can be useful for the detection and diagnosis of S. pneumoniae. The protein sequences are also useful for screening an agent capable of antagonising, inhibiting or interfering with the function or expression of the proteins in which the agent is useful for treatment or prophylaxis of S. pneumoniae infection and meningitis. A05591 to A05614 represent primers used in the exemplification of the present invention.
The present sequence represents an antigenic polypeptide fragment isolated from Enterococcus faecalis. The present invention describgenes, proteins and antigenic polypeptides isolated from E. faecalis. The proteins can be used in vaccines for preventing or attenuation.
                                                                                                New isolated Enterococcus faecalis polynucleotides - used products for the detection of Enterococcus and for use in for prevention or attenuation of Enterococcus infection
                                                                                                                                                                                                                                                                           14-NOV-1997;

```

```
CC infection caused by a member of the Enterococcus genus in an animal.

CC They can also be used for detecting Enterococcus antibodies in a sample.

CC The nucleotide sequences can be used for detecting Enterococcus nucleic cc acids. Products from the present invention can also be used for CC screening compounds to identify agonists and antagonists of E. faecalis cc protein activity.
